

Pouring cold water on global warming

Global cooling has arrived. Global warming is dead.

By Terri Jackson
Wednesday, 13 May 2009

There is now irrefutable scientific evidence that, far from global warming, the earth has now entered a period of global cooling which will last at least for the next two decades.

Evidence for this comes from the NASA Microwave Sounding Unit and the Hadley Climate Research Unit while evidence that CO2 levels are continuing to increase comes from the Mauna Loa Observatory in Hawaii.

Professor Don Easterbrook one of the principal speakers at the recent World Conference on climate change held in New York in March this year, attended by 800 leading climatologists, has documented a consistent cycle of warm and cool periods each with a 27 year cycle. Indeed the warm period from 1976 to 1998 exactly fits the pattern of climate changes for the past several centuries long before there were any CO2 emissions. Greenland Ice core temperature measurements for the past 500 years show this 27 year cycle of alternating warm and cool periods. Recently the global temperature increased from 1918 to 1940, decreased from 1940 to 1976, increased again from 1976 to 1998 and has been decreasing ever since.

However, throughout this time CO2 has been added to the atmosphere in increasing amounts. This point was brought out at the New York conference by Vaclav Klaus, the rotating President of the EU and President of the Czech Republic. If CO2 emissions cause temperature rises, then why is it that every 27 years the earth climate switches to a cooling mode with decreasing temperature? Clearly there is another explanation that does not include humans.

Nearly ten years into the 21 century it is clear that the UN IPCC computer models have gone badly astray. The IPCC models have predicted a one degree increase in global temperature by 2011 with further large temperature rises to 2100. Yet there has been no warming since 1998 with a one degree cooling this year being the largest global temperature change ever recorded. NASA satellite imagery from the Jet Propulsion Laboratory in California has confirmed that the Pacific Ocean has switched from the warm mode it has been in since 1977 to its cool mode, similar to that of the 1945-1977 global cooling period.

The evidence that the earth is in a cooling mode rather than a warming mode is there for all to see. The RSS (Remote Sensing System) in Santa Rosa California has recorded a temperature fall of two to three degrees in the Arctic since 2005, while US Army buoys show an increase in Arctic ice thickness to 3.5 metres. North America has had two of its

worst winters for 60 years with the temperature in Yellowstone Park falling to a staggering minus 60 degrees.

About 46" of snow fell in New York in two weeks! Last February, Toronto had over 70 cms of snow, more than anything since 1950! Snow has fallen in parts of China and Asia for the first time in living memory while Britain had its worst January for 20 years. "The Alps have best snow conditions 'in a generation'" ran a newspaper headline last December. Strange indeed that the BBC, who likes us to believe it is impartial, does not mention these freezing temperatures and Arctic conditions.

Some warming in the Antarctic has only been on a small 20 mile strip of the Antarctic Peninsula as a result of the 1977-1998 warming period. This is insignificant compared to the overall size of the huge Antarctic continent.

Studies by the WeatherAction team (weatheraction.com), led by astrophysicist Piers Corbyn, and also the measurements of sun spots by the Institute of Solar-Terrestrial physics in Irkutsk in Russia, show that over the last 50 years solar activity has been at its highest for the past several thousand years.

The Russian physicists have analysed sun spot activity from 1882 to 2000 and have noted that the minimum of the cycle of solar activity will occur around 2021 to 2026 and that we will be facing not global warming but global cooling leading to a deep freeze around 2050.

The UN IPCC graphics have left out the medieval warming period (950-1300AD) and the Little Ice Age (1350-1850). This alters the picture entirely and does not then portray the alternating warm-cool-warm-cool cycle of recorded world temperatures. Also statements put out by the UN IPCC are unrepresentative of many of its members. I do not recall any votes being taken of the opinion of members.

At the New York climate change conference in March, as well as Vaclav Klaus, delegates also heard Dr. Richard Lindzen from MIT, probably the leading climatologist in the world today, as well as Professor Syun-Ichi Akasofu, former director of the International Arctic Research Center, Dr Willie Soon of the Harvard-Smithsonian Center for Astrophysics and Professor Paul Reiter of the Pasteur Institute, who all demolished the global alarmists' case piece by piece.

In his speech EU President Klaus had these controversial words (<http://www.heartland.org/full/24843>) for the environmentalist lobby:

"Environmentalists—even mainstream environmentalists—are less concerned about any crisis posed by global warming than they are eager to command human behaviour and restrict economic activity." He also said, "Their true plans and ambitions: to stop economic development and return mankind centuries back.

"They are interested in their businesses and their profits—made with the help of politicians."

He got a standing ovation from the assembled audience.

[See also Vaclav Klaus, "Europe, Global Warming and the Current Economic Crisis: As Seen From Prague", <http://www.klaus.cz/klaus2/asp/clanek.asp?id=NK29ATgKc2ah> – Ed.]

His assertion about the involvement of politicians is not surprising. This whole movement is in many parts a political movement with nearly all the recognised climatologists throughout the world dissenting from the manmade global warming theory.

This can be seen on the US Senate Environment committee web site with over 700 leading climatologists from 24 different countries including Nobel Prize laureates all dissenting from the manmade global warming theory. It has been well reported that at least one of the architects of Koyoto has strong links with the New Age Movement which is not a movement that would promote economic growth.

We have all recently noticed the escalating price of food. The reason for this is because American grain, the breadbasket of the world, is increasingly being turned into ethanol which has led to a threefold increase of maize prices worldwide. This has the potential to cause worldwide starvation!

Terri Jackson is a Queens graduate physicist, climatologist and formerly founder of the Energy Group at the Institute of Physics, London.
